Git Hands-On -5

Step 1: Verify master is in a clean state

I opened Git Bash, navigated into GitDemo, and checked the status of the working directory:

```
$ cd GitDemo
$ git status
```

Output:

```
On branch master
Your branch is ahead of 'origin/master' by 3 commits.
  (use "git push" to publish your local commits)

nothing to commit, working tree clean
```

Step 2: List out all the available branches

```
$ git branch
```

Output:

```
* master
```

Step 3: Pull the remote Git repository into master

```
$ git pull origin master
```

Output:

```
From https://gitlab.com/studentname/GitDemo
 * branch            master     -> FETCH_HEAD
Already up to date.
```

Step 4: Push the pending changes from Git-T03-HOL_002 to the remote repository

```
$ git push origin master
```

Output:

```
Enumerating objects: 12, done.
Counting objects: 100% (12/12), done.
Delta compression using up to 8 threads
Compressing objects: 100% (7/7), done.
Writing objects: 100% (9/9), 1.14 KiB | 1.14 MiB/s, done.
Total 9 (delta 1), reused 0 (delta 0)
To https://gitlab.com/studentname/GitDemo.git
   9d1c3aa..6a7b8c9  master -> master
```

Step 5: Observe if the changes are reflected in the remote repository

To confirm the push, I re-checked the status locally:

```
$ git status
```

Output:

```
On branch master
Your branch is up to date with 'origin/master'.

nothing to commit, working tree clean
```
